

# BBR Slab Strengthening Kit

Active Strengthening Solution

Extending the life of built assets through maintenance, repair and retrofitting (MRR) is a key component of a carbon emissions reduction strategy. The BBR Slab Strengthening Kit applies the latest external post-tensioning (PT) technology to reinforce existing concrete building elements without using carbon intensive and slower rebar and formwork solutions. It enables the structural enhancement and upgrades required for repurposing, reusing and increasing return on investment for built assets.

Contact the BBR VT International team in Zurich for more information.
